

On the Subject of Cruel Boolean Math

217 ^ 59

Use the left screen as the first input and the right screen as the second input. Perform the boolean operator listed on the center screen on the two inputs and submit it using the keypad.

The numbers are in decimal, however, and they must first be converted to binary and back to decimal.

In the rare case that the answer is above 999, submit only the last 3 digits.

Be careful, you cannot delete a number once it has been entered, so be careful with what you input.
