# On the Subject of Common Sense

Sorry history nerds, we ain't gonna do anything like that just yet.

When the needy activates, there will be a display which can display a variety of different things. In some prompts, one of the two buttons will be 'correct', and the other one will be 'incorrect'. If the background of the needy is normal when activated, select the 'correct' button. If the background turns red however, select the 'incorrect' button. Other prompts may require pressing the screen or not pressing anything at all, though if the background is red it may still require you to follow the prompt incorrectly. Hitting the wrong button, or letting the needy timer run out when you shouldn't have will cause a strike and deactivate the module.
